

Laboratorio – Uso de Formularios en Angular

Los formularios reactivos son uno de los dos enfoques para construir formularios que ofrece Angular. Ambos enfoques procesan y gestionan los datos del formulario de forma diferente y, por lo tanto, ambos tienen sus propias ventajas. Para soluciones muy simples, que no requieren reutilización, los formularios basados en plantillas son una excelente opción. Esto es particularmente cierto para los equipos que no tienen mucha experiencia en formularios o reactivos. En la mayoría de los otros casos de uso, los beneficios de usar formularios reactivos realmente comienzan a brillar; especialmente cuando su aplicación escala.

@angular/forms

Implementa un conjunto de directivas y proveedores para comunicarse con los elementos nativos del DOM cuando se construyen formularios para capturar la entrada del usuario.

Utiliza esta API para registrar directivas, construir modelos de formularios y datos, y proporcionar validación a tus formularios. Los validadores pueden ser síncronos o asíncronos dependiendo de tu caso de uso. También puedes ampliar la funcionalidad incorporada proporcionada por los formularios en Angular utilizando las interfaces y los tokens para crear validadores y elementos de entrada personalizados.

Los formularios de Angular le permiten:

- Capturar el valor actual y el estado de validación de un formulario.
- Seguir y escuchar los cambios en el modelo de datos del formulario.
- Validar la corrección de la entrada del usuario.
- Crear validadores y elementos de entrada personalizados.

Se puede construir formularios de dos maneras:

- Los formularios reactivos utilizan instancias existentes de un FormControl o FormGroup para construir un modelo de formulario. Este modelo de formulario se sincroniza con los elementos de entrada del formulario a través de directivas para rastrear y comunicar los cambios al modelo de formulario. Los cambios en el valor y el estado de los controles se proporcionan como observables.
- Los formularios basados en plantillas dependen de directivas como NgModel y NgModelGroup que crean el modelo de formulario por ti, por lo que cualquier cambio en el formulario se comunica a través de la plantilla

FormsModule

Exporta los proveedores y las directivas necesarias para los formularios basados en plantillas, haciéndolos disponibles para ser importados por NgModules que importen este módulo.

ReactiveFormsModule

Exporta la infraestructura y las directivas necesarias para los formularios reactivos, haciéndolos disponibles para la importación por parte de los NgModules que importan este módulo.

Los formularios reactivos nos proporcionan una manera de crear formularios inmutables y un enfoque orientado a objetos para crear formularios. De esta manera podemos declarar y manejar fácilmente todas las validaciones y eventos del formulario en un solo lugar y reutilizar el código.

Antes de empezar a construir nuestro propio formulario, es un buen momento para explicar los tres tipos principales de componentes de formulario en Angular forms. Es una buena idea familiarizarse con estos tres, ya que los utilizarás con bastante frecuencia.

FormControls: Son los controles individuales de un formulario que mantienen el valor y la validez.

FormGroup: Es una colección de controles que llevan la cuenta del valor y la validez.

FormArrays: Son un array o lista de controles que mantienen un seguimiento del valor y la validez.

Implementación

Primero, cambiar la versión Bootstrap a versión 5.0

```
<link                                rel="stylesheet"
href="https://cdn.jsdelivr.net/npm/bootstrap@5.0.2/dist/css/boot
strap.min.css"

    rel="stylesheet"                                integrity="sha384-
EVSTQN3/azprG1Anm3QDgpJLIm9Nao0Yz1ztcQTWFspd3yD65VohhpuuCOmLASjC
"

    crossorigin="anonymous">
</head>
```

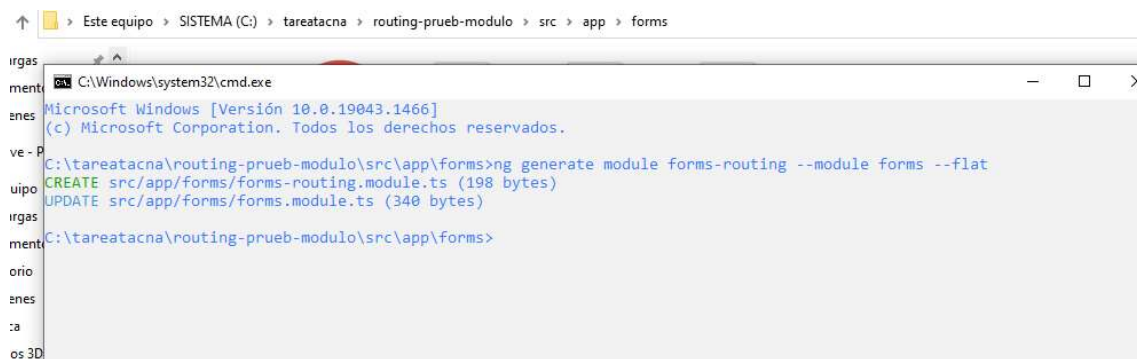

Tomando como base el laboratorio anterior, se va a construir un modulo que mostrara diferentes tipos de formularios que pueden desarrollarse en Angular. Este ejercicio también es interesante debido a que se trata de un modulo que llama a otros módulos dentro de su estructura, es decir submodulos.

Se creara el modulo forms dentro de app, usando GENERATE MODULE.

Como en anteriores ocasiones, no se ha creado automáticamente el archivo *routing.module.ts*, por lo que se debe agregar, mediante la línea de comandos el siguiente código:

```
ng generate module forms-routing --module forms --flat
```

Luego, se ingresara el código de los elementos iniciales de este módulo.

forms.component.ts

sin cambios

forms.component.html

```
<div class="container bd-layout">
  <div class="bd-sidebar">
    <ul class="list-unstyled p-2">
      <li class="mb-1">
        <button class="btn btn-toggle align-items-center rounded
collapsed" data-bs-toggle="collapse"
          data-bs-target="#reactive-collapse" aria-
expanded="true" aria-current="true">
          Reactive
        </button>
        <div class="collapse show" id="reactive-collapse">
          <ul class="btn-toggle-nav list-unstyled fw-normal pb-1
small">
```

```

        <li><a routerLink="/forms/prototype" class="link-
dark rounded">Prototype</a></li>

        <li><a routerLink="/forms/form-control" class="link-
dark rounded">form-control</a></li>

        <li><a routerLink="/forms/form-control-class"
class="link-dark rounded">form-control-class</a></li>

        <li><a routerLink="/forms/form-group" class="link-
dark rounded">form-group</a></li>

        <li><a routerLink="/forms/form-builder" class="link-
dark rounded">form-builder</a></li>

        <li><a routerLink="/forms/form-builder-nested"
class="link-dark rounded">form-builder-nested</a></li>

        <li><a routerLink="/forms/form-array" class="link-
dark rounded">form-array</a></li>

        <li><a routerLink="/forms/form-multi" class="link-
dark rounded">form-multi</a></li>
    </ul>
</div>
</li>
<li class="mb-1">
    <button class="btn btn-toggle align-items-center rounded
collapsed" data-bs-toggle="collapse"
        data-bs-target="#template-collapse" aria-
expanded="false">
        Basado en plantillas
    </button>
    <div class="collapse" id="template-collapse">
        <ul class="btn-toggle-nav list-unstyled fw-normal pb-1
small">
            <li><a routerLink="/forms/single" class="link-dark
rounded">single</a></li>
            <li><a routerLink="/forms/multi" class="link-dark
rounded">multi</a></li>
            <li><a routerLink="/forms/init-class" class="link-
dark rounded">init-class</a></li>

```

```

        </ul>
      </div>
    </li>
  </ul>
</div>

<div class="row">
  <div class="col p-4">
    <router-outlet></router-outlet>
  </div>
</div>

</div>

```

forms.component.css

```

.btn-toggle {
  display: inline-flex;
  align-items: center;
  padding: .25rem .5rem;
  font-weight: 600;
  color: rgba(0, 0, 0, .65);
  background-color: transparent;
  border: 0;
}

.btn-toggle:hover, .btn-toggle:focus {
  color: rgba(0, 0, 0, .85);
  background-color: #cfe2ff;
}

.btn-toggle::before {

```

```
width: 1.25em;

line-height: 0;

content: url("data:image/svg+xml,%3csvg
xmlns='http://www.w3.org/2000/svg' width='16' height='16'
viewBox='0 0 16 16'%3e%3cpath fill='none'
stroke='rgba%280,0,0,.5%29' stroke-linecap='round' stroke-
linejoin='round' stroke-width='2' d='M5 14l6-6-6-
6'/%3e%3c/svg%3e");

transition: transform .35s ease;

transform-origin: .5em 50%;
}
```

```
.btn-toggle[aria-expanded="true"] {
  color: #0d6efd;
}
```

```
.btn-toggle[aria-expanded="true"]::before {
  transform: rotate(90deg);
}
```

```
.btn-toggle-nav a {
  display: inline-flex;
  padding: .1875rem .5rem;
  margin-top: .125rem;
  margin-left: 1.25rem;
  text-decoration: none;
}
```

```
.btn-toggle-nav a:hover, .btn-toggle-nav a:focus {
  color: #0d6efd;
  background-color: #cfe2ff;
  font-weight: bold;
}
```

```
}
```

```
@media (min-width: 768px) {  
  .bd-layout {  
    display: grid;  
    gap: 1.5rem;  
    grid-template-areas: "sidebar main";  
    grid-template-columns: 1fr 3fr  
  }  
}
```

```
@media (min-width: 992px) {  
  .bd-layout {  
    grid-template-columns: 1fr 5fr  
  }  
}
```

```
.bd-sidebar {  
  overflow: auto;  
  font-weight: 600  
}
```

```
@media (min-width: 768px) {  
  .bd-sidebar {  
    position: -webkit-sticky;  
    position: sticky;  
    top: 5rem;  
    display: block !important;  
    height: calc(100vh - 7rem);  
    padding-left: .25rem;  
  }  
}
```

```

        margin-left: -.25rem;
        overflow-y: auto
    }
}

```

el siguiente paso es el registro en module.ts

forms.module.ts

```

import { NgModule } from '@angular/core';
import { CommonModule } from '@angular/common';
import { FormsComponent } from './forms.component';
import { FormsRoutingModule } from './forms-routing.module';
import { HttpClientModule } from '@angular/common/http';
import { RouterModule } from '@angular/router';

```

```

@NgModule({
  imports: [
    CommonModule,
    FormsRoutingModule,
    HttpClientModule,
    RouterModule
  ],
  exports: [
    FormsComponent,
  ],
  declarations: [FormsComponent]
})
export class FormsModule { }

```

como se observa, se ha agregado al modulo **HttpClientModule** a las declaraciones, asi como **RouterModule**, indispensable para usar la etiqueta <router-outlet></router-outlet>.

Luego se establece el registro de routing.module.ts

forms.routing.module.ts

```
import { NgModule } from '@angular/core';
import { CommonModule } from '@angular/common';
import { Routes, RouterModule } from '@angular/router';
import { FormsComponent } from '../forms.component';

const routes: Routes = [
  { path: '', component: FormsComponent, children: [
    { path: 'forms', component: FormsComponent }
  ]}
]

@NgModule({
  declarations: [],
  imports: [CommonModule, RouterModule.forChild(routes)],
  exports: [RouterModule]
})

export class FormsRoutingModule { }
```

A continuación, se agregara el registro en app.module.ts:

```
TS forms-routing.module.ts U TS app.module.ts M X
src > app > TS app.module.ts > AppModule
1 import { NgModule } from '@angular/core';
2 import { BrowserModule } from '@angular/platform-browser';
3
4 import { AppRoutingModule } from './app-routing.module';
5 import { AppComponent } from './app.component';
6 import { AboutModule } from './about/about.module';
7 import { PruebaComponent } from './prueba/prueba.component';
8 import { AngularModule } from './angular/angular.module';
9 import { SongModule } from './song/song.module';
10 import { FormsModule } from './forms/forms.module';
11
12 @NgModule({
13   declarations: [
14     AppComponent,
15     PruebaComponent
16   ],
17   imports: [
18     BrowserModule,
19     AppRoutingModule,
20     AboutModule,
21     AngularModule,
22     SongModule,
23     FormsModule
```

luego, se crea el route para este módulo en routing.module.ts inicial

```
import { PruebaComponent } from './prueba/prueba.component';
import { NgModule } from '@angular/core';
import { RouterModule, Routes } from '@angular/router';
import { AboutModule } from './about/about.module';
import { AngularModule } from './angular/angular.module';
import { SongModule } from './song/song.module';
import { FormsModule } from './forms/forms.module';
```

```
const routes: Routes = [
  {
    path: 'about',
    loadChildren: () =>
import(`./about/about.module`).then(m => m.AboutModule) },
  {
    path: 'angular',
    loadChildren: () =>
import(`./angular/angular.module`).then(m => m.AngularModule) },
  {
    path: 'song',
    loadChildren: () =>
import(`./song/song.module`).then(m => m.SongModule) },
  {
    path: 'forms',
    loadChildren: () =>
import(`./forms/forms.module').then(m => m.FormsModule) },
```

```

    { path: '', component: PruebaComponent}
  ];

@NgModule({
  imports:      [RouterModule.forRoot(routes,{enableTracing:
false})],
  exports: [RouterModule]
})
export class AppRoutingModule { }

```

Ahora, el siguiente paso es crear submodulos del módulo **forms**

a. Modulo single

este submodulo será parte de la pantalla inicial de Forms.

Como siempre debe crear el archivo routing de este módulo.

```
ng generate module single-routing --module single --flat
```

se ingresarán los datos de este submodulo:

archivo **items.ts**

```

export const ITEMS: any[] =
[
  { id: 1, name: 'prototype', link: 'prototype', icon: 'far fa-address-card' },
  { id: 2, name: 'form-control', link: 'form-control', icon: 'fas fa-user' },
  { id: 3, name: 'form-control-class', link: 'form-control-class', icon: 'fas fa-user-friends' },

```

```

    { id: 4, name: 'form-group', link: 'form-group', icon: 'fas
fa-house-user' },

    { id: 5, name: 'form-builder', link: 'form-builder', icon:
'fab fa-app-store' },

    { id: 6, name: 'form-builder-nested', link: 'form-builder-
nested', icon: 'fab fa-artstation' },

    { id: 7, name: 'form-array', link: 'form-array', icon: 'fab
fa-asymmetrik' },

    { id: 8, name: 'form-multi', link: 'form-multi', icon: 'fas
fa-atom' },

    { id: 9, name: 'single', link: 'single2', icon: 'fab fa-
centos' },

    { id: 10, name: 'multi', link: 'multi', icon: 'fas fa-chart-
line' },

    { id: 11, name: 'init-class', link: 'init-class', icon: 'fas
fa-cogs' },

];

```

single.component.ts

```

<div class="row mb-1">

  <div class="col-md-12 text-center">

    <h2 class="h4">Forms Features&nbsp;&nbsp;<i class="fab fa-bootstrap"></i></h2>

  </div>

</div>

<div class="row pt-2">

  <div *ngFor="let item of items" class="col-12 col-sm-12 col-md-6 col-lg-4 col-xl-3 mb-
2">

    <div class="nga-card-rotate">

      <a style="cursor:pointer" routerLink="/forms/{{ item.link }}">

        <div class="card">

          <div class="nga-card-header">

```

```

<div class="row mt-2">
  <div class="col-9 col-xl-9">
    <h5 class="card-title text-primary">{{ item.name }}</h5>
  </div>
  <div class="col-3 col-xl-3">
    <i class="{{ item.icon }} fa-lg text-dark"></i>
  </div>
</div>
</div>
</div>
</div>
</a>
</div>
</div>
</div>

```

single.component.css

```

.card {
  -webkit-transition: -webkit-transform 1s;
  -moz-transition: -moz-transform 1s;
  -o-transition: -o-transform 1s;
  transition: transform 1s;
  -webkit-transform-style: preserve-3d;
  -moz-transform-style: preserve-3d;
  -o-transform-style: preserve-3d;
  transform-style: preserve-3d;
  position: relative;
}

```

```

.nga-card-header {
  padding: 0.5rem 1rem;
}

```

```
margin-bottom: 0;
background-color: white;
}
```

```
.nga-card-rotate {
  -webkit-perspective: 800px;
  -moz-perspective: 800px;
  -o-perspective: 800px;
  perspective: 800px;
  margin-bottom: 30px;
}
```

```
.nga-card-rotate a {
  text-decoration: none;
}
```

```
.nga-card-rotate:not(.manual-flip):hover .card,
.nga-card-rotate.hover.manual-flip .card {
  -webkit-transform: rotateY(180deg);
  -moz-transform: rotateY(180deg);
  -o-transform: rotateY(180deg);
  transform: rotateY(180deg);
}
```

se muestra el código de module.ts

single.module.ts

```
src > app > forms > single > TS single.module.ts > ...
1  import { NgModule } from '@angular/core';
2  import { CommonModule } from '@angular/common';
3  import { SingleComponent } from './single.component';
4  import { SingleRoutingModule } from './single-routing.module';
5
6  @NgModule({
7    imports: [
8      CommonModule,
9      SingleRoutingModule
10   ],
11   declarations: [SingleComponent]
12 })
13 export class SingleModule { }
14
```

Luego se completa el código con el routing.module.ts

single.routing.module.ts

```
import { NgModule } from '@angular/core';
import { CommonModule } from '@angular/common';
import { Routes, RouterModule } from '@angular/router';
import { SingleComponent } from './single.component';
const routes: Routes = [
  { path: '', component: SingleComponent, children: [] }
];

@NgModule({
  declarations: [],
  imports: [
    CommonModule,
    RouterModule.forChild(routes)
  ],
  exports: [RouterModule]
})
export class SingleRoutingModule { }
```

Luego, definiremos el módulo en *forms.module.ts*

```
app > forms > TS forms.module.ts > FormsModule

import { NgModule } from '@angular/core';
import { CommonModule } from '@angular/common';
import { FormsComponent } from './forms.component';
import { FormsRoutingModule } from './forms-routing.module';
import { HttpClientModule } from '@angular/common/http';
import { RouterModule } from '@angular/router';
import { SingleModule } from './single/single.module';

@NgModule({
  imports: [
    CommonModule,
    FormsRoutingModule,
    HttpClientModule,
    RouterModule,
    SingleModule
  ],
  exports: [
    FormsComponent,
  ],
  declarations: [FormsComponent]
})
export class FormsModule { }
```

y finalmente, se modifica **forms.routing.module.ts**

```
import { NgModule } from '@angular/core';
import { CommonModule } from '@angular/common';
import { Routes, RouterModule } from '@angular/router';
import { FormsComponent } from './forms.component';
import { SingleModule } from './single/single.module';

const routes: Routes = [
```

```

{ path: '', component: FormsComponent, children: [
  { path: '',
    loadChildren: () => import('./single/single.module')
      .then(mod => mod.SingleModule)},
  ]}
]

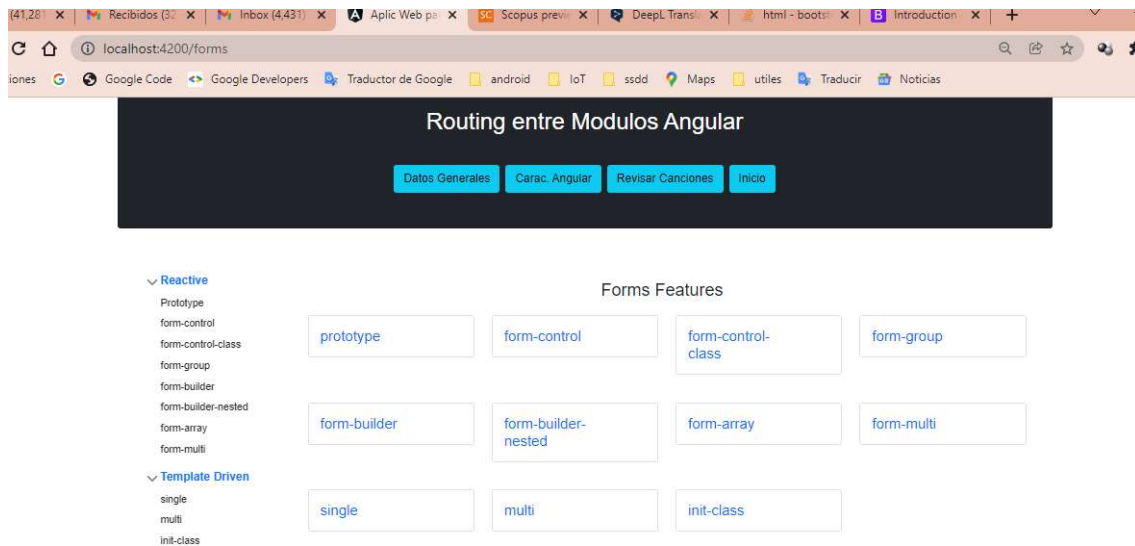

```

```

@NgModule({
  declarations: [],
  imports: [CommonModule, RouterModule.forChild(routes)],
  exports: [RouterModule]
})
export class FormsRoutingModule { }

```

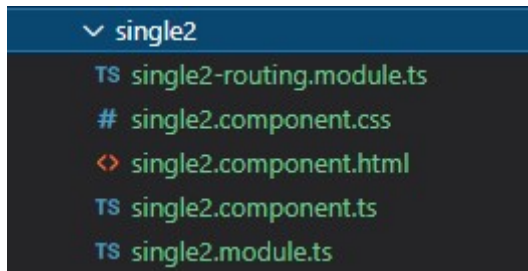

una vez hecho esto, se obtiene la pantalla básica de Forms

Una vez que la vista básica se ha construido, se implementaran los submodulos que serán llamados a travez de esta vista.

b. Modulo single2

ng generate module single2-routing --module single2 --flat

single2component.ts

```
import { Component, OnInit } from '@angular/core';
```

```
@Component({
  selector: 'app-single2',
  templateUrl: './single2.component.html',
  styleUrls: ['./single2.component.css']
})
export class Single2Component implements OnInit {

  firstName = 'Paul';
  lastName = 'Atreides';

  constructor() { }

  ngOnInit() {
  }

}
```

single2component.html

```
<div class="card">
  <div class="card-body">
```

```

<h5 class="card-title">Template Driven Form Single Test</h5>
<hr>
<div class="row">
  <div class="col-6">
    <form>
      <div class="mb-3">
        <label for="firstName" class="form-label">First
Name</label>
        <input type="text" class="form-control"
id="firstName" name="firstName" [(ngModel)]="firstName"
        aria-describedby="firstNameHelp">
      </div>
      <div class="mb-3">
        <label for="lastName" class="form-label">Last
Name</label>
        <input type="text" class="form-control" id="lastName"
name="lastName" [(ngModel)]="lastName"
        aria-describedby="lastNameHelp">
      </div>
      <button type="submit" class="btn btn-
primary">Submit</button>
    </form>
  </div>
  <div class="col-6">
    Input Result
    <div class="alert alert-primary" role="alert">
      firstName : {{ firstName }}
    </div>
    <div class="alert alert-primary" role="alert">
      lastName : {{ lastName }}
    </div>
  </div>
</div>

```

```
    </div>
  </div>
</div>
```

single2.module.ts

```
import { NgModule } from '@angular/core';
import { CommonModule } from '@angular/common';
import { Single2Component } from './single2.component';
import { Single2RoutingModule } from './single2-routing.module';
import { FormsModule } from '@angular/forms';
```

```
@NgModule({
  imports: [
    CommonModule,
    Single2RoutingModule,
    FormsModule
  ],
  declarations: [Single2Component]
})
export class Single2Module { }
```

single2.routing.module.ts

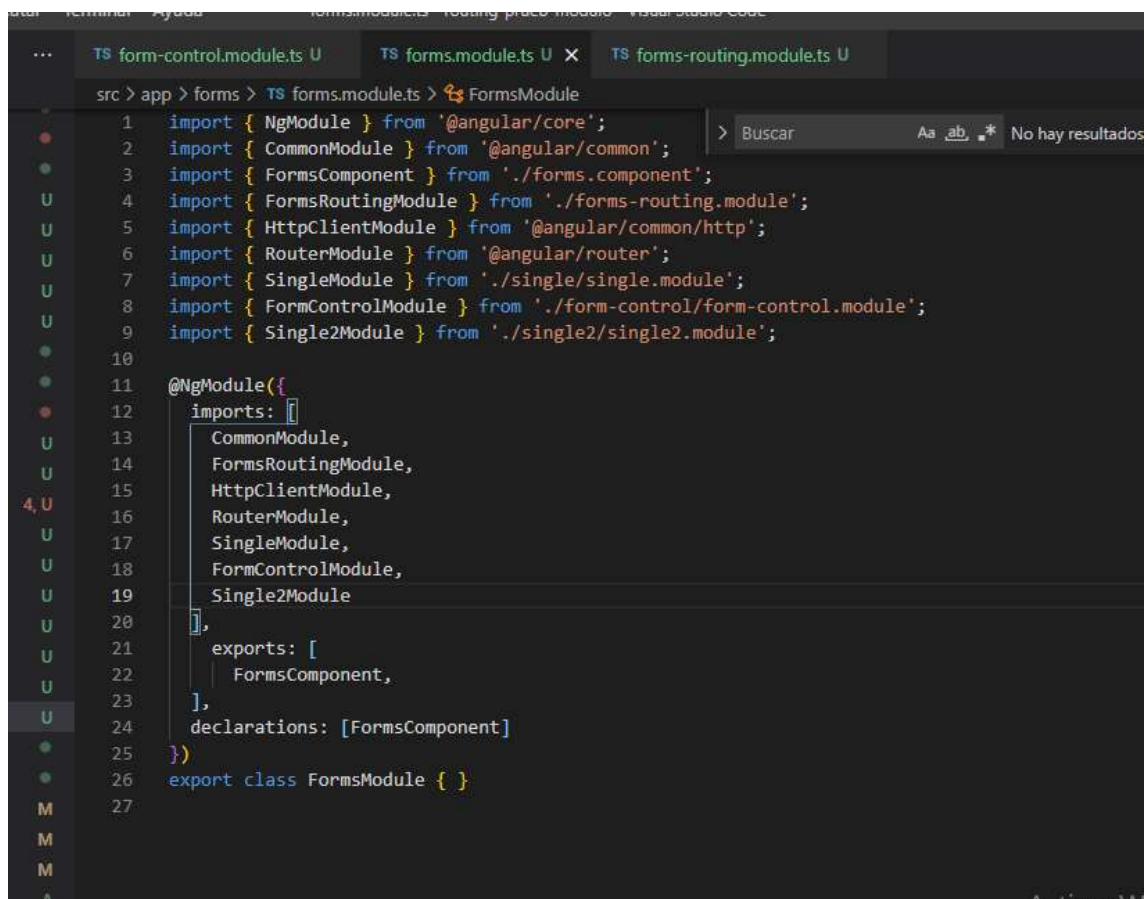

```
import { NgModule } from '@angular/core';
import { CommonModule } from '@angular/common';
import { Routes, RouterModule } from '@angular/router';
import { Single2Component } from './single2.component';
```

```
const routes: Routes = [
  {
    path: '',
    component: Single2Component,
  },
];
```

```
];
```

```
@NgModule({  
  declarations: [],  
  imports: [  
    CommonModule,  
    RouterModule.forChild(routes)],  
  exports: [RouterModule]  
})  
  
export class Single2RoutingModule { }
```

se modifica **forms.module.ts**

finalmente, se modifica **forms.routing.module.ts**

```
const routes: Routes = [  
  { path: '', component: FormsComponent, children: [  

```

```

{
  path: '',
  loadChildren: () => import('./single/single.module')
    .then(mod => mod.SingleModule)},
{
  path: 'form-control',
  loadChildren: () => import('./form-control/form-control.module')
    .then(mod => mod.FormControlModule)
},
{
  path: 'single2',
  loadChildren: () => import('./single2/single2.module')
    .then(mod => mod.Single2Module)
},
]}
]

```

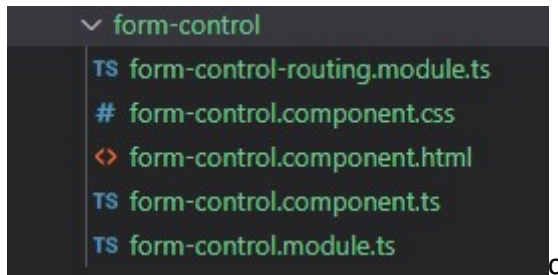

- ▼ Reactive
 - Prototype
 - form-control
 - form-control-class
 - form-group
 - form-builder
 - form-builder-nested
 - form-array
 - form-multi
- ▼ Template Driven
 - single
 - multi
 - init-class

Template Driven Form Single Test	
First Name <input type="text" value="Jorge"/>	Input Result <div>firstName : Jorge</div>
Last Name <input type="text" value="Guerra"/>	<div>lastName : Guerra</div>
<input type="button" value="Submit"/>	

c. Modulo FormControl

ng generate module form-control-routing --module form-control --flat

form-control.component.ts

```
import { Component, OnInit } from '@angular/core';
```

```
import { FormControl } from '@angular/forms';
```

```
@Component({
```

```
  selector: 'app-form-control',
```

```
  templateUrl: './form-control.component.html',
```

```
  styleUrls: ['./form-control.component.css']
```

```
})
```

```
export class FormControlComponent implements OnInit {
```

```
  name = new FormControl("");
```

```
  releaseDate = new FormControl("");
```

```
  franchise = new FormControl("");
```

```
  budget = new FormControl("");
```

```
  worldwide = new FormControl("");
```

```
  summary = new FormControl("");
```

```
  constructor() { }
```

```
  ngOnInit() {
```

```
    this.updateControls();
```

```
  }
```

```
  updateControls(): void {
```

```
    this.name.setValue('Avengers: Endgame');
```

```

this.releaseDate.setValue('26/04/2019');

this.franchise.setValue(true);

this.budget.setValue('356000000');

this.worldwide.setValue('2797800564');

this.summary.setValue('Tras los devastadores acontecimientos de Vengadores:
Infinity War (2018), ' +
    'el universo esta en ruinas.');
```

```

resetControls(): void {
    this.name.setValue(null);
    this.releaseDate.setValue(null);
    this.franchise.setValue(null);
    this.budget.setValue(null);
    this.worldwide.setValue(null);
    this.summary.setValue(null);
}
```

```

}
```

form-control.component.html

```

<div class="card">
  <div class="card-body">
    <div class="row">
      <div class="col-12 col-sm-12 col-md-7 col-lg-7 col-xl-7">

    RouterModule.forChild(routes)  
  ],  
  exports: [RouterModule]  
})  
export class PrototypeRoutingModule { }
```

A continuación, el registro del modulo en **forms.module.ts**

```
src > app > forms > TS forms.module.ts > FormsModule
1 import { NgModule } from '@angular/core';
2 import { CommonModule } from '@angular/common';
3 import { FormsComponent } from './forms.component';
4 import { FormsRoutingModule } from './forms-routing.module';
5 import { HttpClientModule } from '@angular/common/http';
6 import { RouterModule } from '@angular/router';
7 import { SingleModule } from './single/single.module';
8 import { FormControlModule } from './form-control/form-control.module';
9 import { Single2Module } from './single2/single2.module';
10 import { PrototypeModule } from './prototype/prototype.module';
11
12 @NgModule({
13   imports: [
14     CommonModule,
15     FormsRoutingModule,
16     HttpClientModule,
17     RouterModule,
18     SingleModule,
19     FormControlModule,
20     Single2Module,
21     PrototypeModule
22   ],
23   exports: [
24     FormsComponent,
25   ],
26   declarations: [FormsComponent]
27 })
28 export class FormsModule { }
29
```

y finalmente definiendo la ruta en **forms.routing.module.ts**

```
const routes: Routes = [
  { path: '', component: FormsComponent, children: [
    {
      path: '',
      loadChildren: () => import('./single/single.module')
        .then(mod => mod.SingleModule)},
    {
      path: 'form-control',
      loadChildren: () => import('./form-control/form-
control.module')
        .then(mod => mod.FormControlModule)
    },
    {
```

```

    path: 'single2',
    loadChildren: () => import('./single2/single2.module')
      .then(mod => mod.Single2Module)
  },
  {
    path: 'prototype',
    loadChildren: () =>
import('./prototype/prototype.module')
      .then(mod => mod.PrototypeModule)
  },
]}
]

```

The screenshot displays a web application with a form builder interface. On the left, a sidebar lists components under 'Reactive' (Prototype, form-control, form-control-class, form-group, form-builder, form-builder-nested, form-array, form-multi) and 'Template Driven' (single, multi, init-class). The main area shows a form with the following fields:

- Email:** jguerra91@gmail.com
- Password:** (masked with dots)
- Address:** Av. Antunez de Mayolo 1944 URB COVIDA Los Olivos
- Address 2:** piso 1
- City:** Lima
- Zip:** Choose... (dropdown menu)
- Check me out:** (checkbox)
- Sign in buttons:** Five blue buttons labeled 'Sign in'.

Below the main form, there is a section titled 'FormControl' with the following fields:

- Name:** Avengers: Endgame
- Release Date:** April 24, 2019
- Budget:** \$356,000,000
- Worldwide:** \$2,797,800,564

The bottom of the image shows a Windows watermark: 'Activar Windows. Ve a Configuración para activar Windows.'

e. Modulo FormBuilder

ng generate module form-builder-routing --module form-builder --flat

Previamente se creará un pipe que se utilizara para cambiar texto de la sintaxis HTML.
Este pipe se denominará *pretty-json*.

```
import { Pipe, PipeTransform } from '@angular/core';

@Pipe({
  name: 'prettyjson'
})
export class PrettyJsonPipe implements PipeTransform {

  transform(value: any, ...args: any[]): any {
    return JSON.stringify(value, null, 2)
      .replace(/ /g, '&nbsp;')
      .replace(/\n/g, '<br/>');
  }
}
```

Este pipe se usara dentro de este modulo.

form-builder.component.ts

```
import { Component, OnInit } from '@angular/core';
import { FormBuilder } from '@angular/forms';

@Component({
  selector: 'app-form-builder',
```

```

    templateUrl: './form-builder.component.html',
    styleUrls: ['./form-builder.component.css']
  })
  export class FormBuilderComponent implements OnInit {

    exampleForm = this.fb.group({
      name: [''],
      releaseDate: [''],
      franchise: [''],
      budget: [''],
      worldwide: [''],
      summary: [''],
    });

    constructor(private fb: FormBuilder) { }

    ngOnInit() {
      this.updateControls();
    }

    updateControls(): void {
      this.exampleForm.patchValue({
        name: 'Avengers: Endgame',
        releaseDate: '26/04/2019',

4">
    <button type="submit" (click)="updateControls()"
class="btn btn-primary btn-sm">Update Controls</button>
</div>
</form>
</div>
<div class="col-12 col-sm-12 col-md-5 col-lg-5 col-xl-5">
    <h5 class="card-title text-center text-
primary">FormBuilder Result</h5>
    <strong>Value with prettyjson</strong>
    <div [innerHTML]="exampleForm.value | prettyjson"></div>
    <strong>Value with json</strong>
    <div [innerHTML]="exampleForm.value | json"></div>
</div>
</div>

```

</div>

</div>

form-builder.module.ts

```
import { NgModule } from '@angular/core';
import { CommonModule } from '@angular/common';
import { FormBuilderComponent } from './form-builder.component';
import { FormBuilderRoutingModule } from './form-builder-
routing.module';
import { FormsModule } from '@angular/forms';
import { ReactiveFormsModule } from '@angular/forms';
import { PrettyJsonPipe } from './pretty-json.pipe';
```

```
@NgModule({
  imports: [
    CommonModule,
    FormBuilderRoutingModule,
    FormsModule,
    ReactiveFormsModule
  ],
  declarations: [
    FormBuilderComponent,
    PrettyJsonPipe
  ],
  exports: [
    FormBuilderComponent
  ],
})
export class FormBuilderModule { }
```

form-builder.routing.module.ts

```

import { NgModule } from '@angular/core';
import { CommonModule } from '@angular/common';
import { PrettyJsonPipe } from './pretty-json.pipe';
import { Routes, RouterModule } from '@angular/router';
import { FormBuilderComponent } from './form-builder.component';

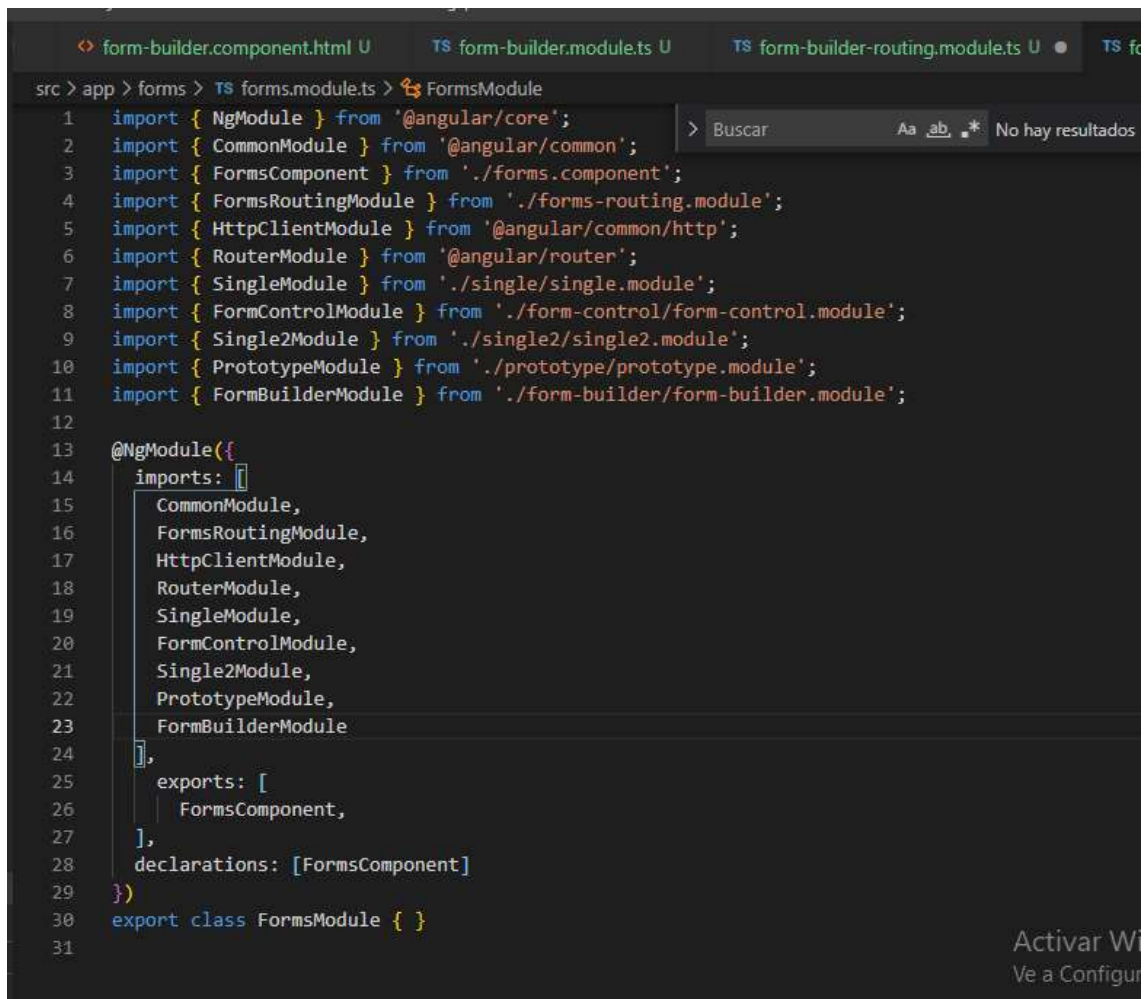

const routes: Routes = [
  { path: '', component: FormBuilderComponent, children: [] }
];

@NgModule({
  declarations: [

  ],
  imports: [
    CommonModule,
    RouterModule.forChild(routes)
  ],
  exports: [RouterModule]
})
export class FormBuilderRoutingModule { }

```

modificando **forms.module.ts**

```
src > app > forms > TS forms.module.ts > FormsModule
1  import { NgModule } from '@angular/core';
2  import { CommonModule } from '@angular/common';
3  import { FormsComponent } from './forms.component';
4  import { FormsRoutingModule } from './forms-routing.module';
5  import { HttpClientModule } from '@angular/common/http';
6  import { RouterModule } from '@angular/router';
7  import { SingleModule } from './single/single.module';
8  import { FormControlModule } from './form-control/form-control.module';
9  import { Single2Module } from './single2/single2.module';
10 import { PrototypeModule } from './prototype/prototype.module';
11 import { FormBuilderModule } from './form-builder/form-builder.module';
12
13 @NgModule({
14   imports: [
15     CommonModule,
16     FormsRoutingModule,
17     HttpClientModule,
18     RouterModule,
19     SingleModule,
20     FormControlModule,
21     Single2Module,
22     PrototypeModule,
23     FormBuilderModule
24   ],
25   exports: [
26     FormsComponent,
27   ],
28   declarations: [FormsComponent]
29 })
30 export class FormsModule { }
31
```

y agregando ruta usando **forms.routing.module.ts**

```
const routes: Routes = [
  { path: '', component: FormsComponent, children: [
    {
      path: '',
      loadChildren: () => import('./single/single.module')
        .then(mod => mod.SingleModule)},
    {
      path: 'form-control',
      loadChildren: () => import('./form-control/form-control.module')
        .then(mod => mod.FormControlModule)
    },
  ],
}
```

```
{
  path: 'single2',
  loadChildren: () => import('./single2/single2.module')
    .then(mod => mod.Single2Module)
},
{
  path: 'prototype',
  loadChildren: () => import('./prototype/prototype.module')
    .then(mod => mod.PrototypeModule)
},
{
  path: 'form-builder',
  loadChildren: () => import('./form-builder/form-builder.module')
    .then(mod => mod.FormBuilderModule)
},
]}
]
```
